Introduction

Air pollution is a major environmental problem. It affects respiratory health and quality of life. Urban areas face increasing pollution levels. Real-time monitoring and reporting systems are needed. Growing air pollution requires data-driven solutions.

Need for structured data collection and analysis of pollution complaints. Absence of a centralized digital monitoring system. Importance of using data analytics to support environmental decision-making. Need for data visualization and trend analysis to identify high-risk pollution areas.

Problem Statement

- Air pollution is increasing and severely affecting public health. However, there is no simple and centralized platform for citizens to report pollution issues with real-time location details, making it difficult for authorities to identify pollution hotspots and take timely action.
- Currently, there is no system that allows citizens to submit air pollution complaints, share health impacts, and provide suggestions. Due to this lack of real-time and area-wise monitoring, authorities may not fully understand local pollution conditions, leading to delayed and ineffective responses.

H/W & S/W Requirements

HARDWARE REQUIREMENTS

- Processor: Intel Core i3/i5 or above
- RAM: Minimum 4GB
- Hard Disk: 500GB or above
- Internet Connection

SOFTWARE REQUIREMENTS

- Operating System: Windows 10/11
- Frontend: HTML, CSS, JavaScript
- Backend: Python (Flask/Django)
- Database: MySQL
- Tools: VS Code
- Web Browser: Google Chrome

Existing System:

Pollution Complaints are mostly reported manually. Citizens must visit government offices or helplines. No centralized online complaint tracking system. Delays in response from authorities. Lack of real-time monitoring and data analysis.

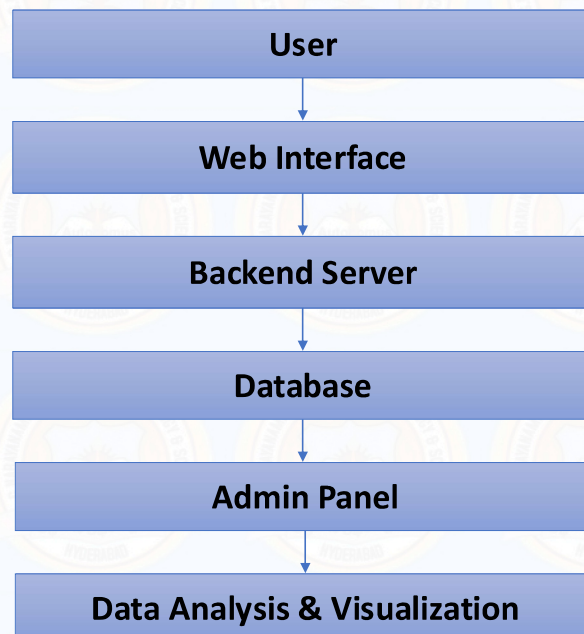

Poor communication between citizens and officers. No area-wise data visualization. Complaints are often recorded on paper, making data storage and retrieval difficult.

There is no proper tracking system to update citizens about the status of their complaints.

Proposed System

- Users submit complaints through website.
- Data is stored in database.
- Admin monitors complaints area-wise.
- System identifies pollution hotspots.
- Generates alerts and visual reports.
- Provides trend analysis to identify high-risk pollution zones.

Proposed System(Block diagram)
